ABSTRACT OF THE DISCLOSURE

- 1 A shock absorbing suspension for the large rear wheels of a wheelchair is disclosed. A
- 2 fork element is hinged at one end to a clamping member which attaches to a horizontal frame
- 3 member of the wheelchair. A cylindrical solid polymer shock absorber cushions the movement of
- 4 the fork element toward the clamping member. The free end of the fork element includes an
- 5 axleway for the axle of a large wheelchair wheel. The movement of the fork element relative to the
- 6 clamping member is limited by abutting surfaces on the fork element and the clamping member.
